

VP Studio is a complete design, data, and production suite for VPs printers. Print to the machine from any Windows program through a placement popup, or build full variable-data jobs in the Studio — both paths share one industrial print service, real pen-and-seam geometry from your printer's own configuration, and piece counts confirmed by the printer itself.

PRINT FROM ANYTHING

- Installs as a normal Windows printer — Word, BarTender, Stamps.com, FlexMail.
- Your media sizes appear in every program's paper list — envelopes, stakes, seed packets, from a built-in trade catalog.
- Placement popup with draggable bands, one-click auto-place, coverage and seam warnings.
- One placement per job; remembered placements; huge jobs stream.
- Queue progress = pieces physically printed.

DESIGN & DATA

- Full VDP canvas: fonts, tokens, counters, conditionals, linked address blocks — with smart alignment guides.
- 39 barcode symbologies incl. USPS IMB, QR, DataMatrix, GS1 — with shave/BWR.
- Data from CSV, Excel, Access, dBase, XML, multi-page PDF — with built-in data-quality checks.
- Home tab with live previews of recent and saved jobs.
- Fit-to-pen and a seam-aware one-click optimizer.

RUN WITH CONFIDENCE

- Printer-confirmed piece flags; live next-up tracking; honest abort.
- Pause feeding anytime — the run waits for media instead of aborting.
- Run summaries with pieces, time, rate, and real ink cost from the printer's drop counters.
- Smart purging + keep-alive jetting protect the pens.
- Relay events and batch breaks for feeders and conveyors.
- Machine control on the Print page — and runs that start and stop the transport, feeder and vacuum themselves, in your order, with your timings — when Print is pressed, or once the printer is ready.
- Scan a cartridge to set its ink printer-wide; tap a job card to open a job — or a run card to open it and start printing — from the machine's reader or a plug-in scanner.
- Print postage as you print the piece — the Stamps.com add-on keeps balance, rates and refunds inside Studio.
- Automatic update checks with one-click rollback.

See it run on your own artwork — every install includes a free full-featured mock mode: design jobs, load data, and simulate production piece by piece with no printer attached.

VP Studio Suite — what's in the box

ONE SUITE, FOUR PARTS

VP Studio

The design and production app: Home, Studio, Data, Print and Postage pages with live context on every tab — and the printer's status and your dealer's mark always in view.

The VPs Studio Windows printer

Anything that prints, prints to the machine — through a placement popup that shows exactly where the heads will put ink.

The tray companion

Ink profiles, maintenance purges, relay tests, bench trigger, production history, and quick settings — one right-click away.

The print service

Starts with Windows and serves both print paths — jobs never fight over the hardware, and it releases the printer when idle so XiJet's own utilities still work.

BUILT FOR THE SHOP FLOOR

Real geometry, everywhere

Bands, pen stitch seams, and mount-edge readouts come from your printer's own configuration — what you see is what the heads print, to 1/600".

Honest production numbers

A piece counts as printed when the printer's completion counter says so — on the Print page, in the Windows queue, and in the run summary.

Pen care built in

Smart purge bars ink only stale nozzle rows; random keep-alive jetting rides invisibly on every print, driver and Studio alike.

Scan the ink, tap the job

Scan a cartridge and its ink profile is set printer-wide; keep recurring jobs on NFC cards or QR codes and tap to open — or to open and start. Pre-written card packs need nothing written: tap, pick the job, done. A kiosk screen tells the operator exactly that.

Move a machine in one file

Export sizes, ink profiles, placements, and settings — optionally the jobs themselves — to a single file; restore selectively on the new PC.

Painless updates

Daily update checks with release notes, checksum-verified installs, and one-click reinstall of the previous version.

Editions that fit

Driver-only licensing for print-from-Windows shops; FULL adds Studio production; add-on keys unlock postage. Keys are machine-bound, survive reinstalls, and timed trials are clock-tamper protected.

Your dealer, built in

A dealer code puts your dealer's logo and contacts in the app — with one-click supply reorders and license requests that go straight to them.

FITS YOUR MACHINES

Any pen arrangement — automatically

The suite reads the pen layout straight from the board's own calibration and adapts on its own: split print zones, one or two headboards, any stagger.

Pens aligned by scanner

Print the alignment target, scan it on any flatbed, and Studio measures every stitch seam, pen offset and photocell distance against what the head holds — apply the fix in one click, print a certificate, restore the previous stitching any time.

Help built in

Press F1 on any screen for the topic you're standing on — instant offline search and real screenshots, no internet needed.

Runs on a plain Windows PC

One installer carries the USB driver and runtime — a fresh PC needs nothing else. Windows 10/11, 64-bit.

Digitally signed

The installer and every program carry a verified TNR Developments, LLC. signature — no unknown-publisher warnings, on any machine.

Dealer-purchased system? Your dealer handles licensing and support. Direct: TNR Developments — we build, ship, and support the suite ourselves.
